INTRODUCTION

General Information:

The California Office of Statewide Health Planning and Development (OSHPD) provides public datasets of data collected from licensed emergency departments and ambulatory surgery centers in California. The ambulatory surgery data includes both hospital-based and freestanding clinics. Each record within the dataset consists of one outpatient encounter, also known as a service visit, for each time a patient is treated. Data collected for these encounters include demographic, clinical, payment, and facility information.

The public data is released twice a year by OSHPD once it has been screened by the automated reporting software (MIRCal) and corrected by the individual facilities. Separate public files are available for emergency departments and ambulatory surgery center encounters. Because of its size, the emergency department data is divided into three separate files based on the geographic location of the facility as indicated below:

- Los Angeles County
- Southern California (seven counties, not including Los Angeles)
- Northern California (50 counties)

Masked Variables:

To protect patient confidentiality, records with unique combinations of certain demographic variables will have one or more of those variables masked to make sure the files are de-identified. In most cases masking involves defaulting the variable to blank or missing. Each unique record will have the minimum number of fields masked to ensure it is no longer unique.

The variable masking occurs in the following order:

ORDER OF MASKING	DATA FIELDS SUBJECT TO MASKING
1 st	Age in years (on service date)
2 nd	Ethnicity
3 rd	Race
4 th	Sex
5 th	Age Category 20 (20 Age Categories)
6 th	Age Category 5 (5 Age Categories)
7 th	Service Quarter
8 th	Patient ZIP Code (5-digit)*
9 th	Small County Groups**
10 th	Patient ZIP Code (3-digit)*
	<p>*Five-digit ZIP will be masked to three-digits; if record is still unique, ZIP will be totally masked with an asterisk.</p> <p>**Small counties with total populations of 30,000 or less are grouped into 3 categories: Central (CE), Northeastern (NE), and Northwestern (NW). Listings of small counties for each reporting year are provided in Appendix A along with the number of records that were masked by variable.</p>

Modifications and Variant Action Reports:

Some facilities have applied for and been granted "modifications" to standard emergency department or ambulatory surgery data reporting requirements. Other facilities were unable to complete specific fields as required and were deemed "non-compliant" at the time of reporting. See Appendix B (Data Exceptions and Modifications) for a listing of all non-compliant facilities and those with approved modifications and their affected variables.

Importing Notes:

There are several fields that although they appear to contain numeric data, should be treated as text. This is particularly important when working with diagnosis and procedure codes. These fields are comprised of ICD-9-CM (diagnosis) and CPT (procedure) codes. Diagnosis and procedure codes are stored without decimals and many contain leading zeros. For example, the ICD-9-CM code for Salmonella Gastroenteritis is "003.0" (implied decimal following the third digit from the left). If it is not formatted as text, the leading zeros may be dropped and the code will appear as "30", an invalid diagnosis code.

File Format:

In the comma-delimited set, the length of each field and the length of each record will vary according to the data reported. To assist you in using the comma delimited patient-level datasets, a header row identifying each data element is provided in the position of the first record. The SAS data set was created using SAS version 9.1 for Windows.

The attributes for each data field is provided below.

Note: because of the number of individual Zip Codes only the masked values are displayed in the above table. The 3-digit Zip Code is a substring of the 5-digit Zip Code and represents the first three digits of the original zip code. When the 5-digit zip code is masked only the first three digits are represented followed by two spaces (a 3-digit zip). When then 3-digit zip is masked the entire zip code is set to missing. The percentage of 3-digit zip codes masked is based on only those zip codes originally masked to the 3-digit level.
